

Fixed panel metal glazed screens

Fixed frames can be heavy or light but frames tend to be 40-50 mm width and use T of L profiles. Glass is best held in place by small metal angles 10 x 10 L sections or even square sections.

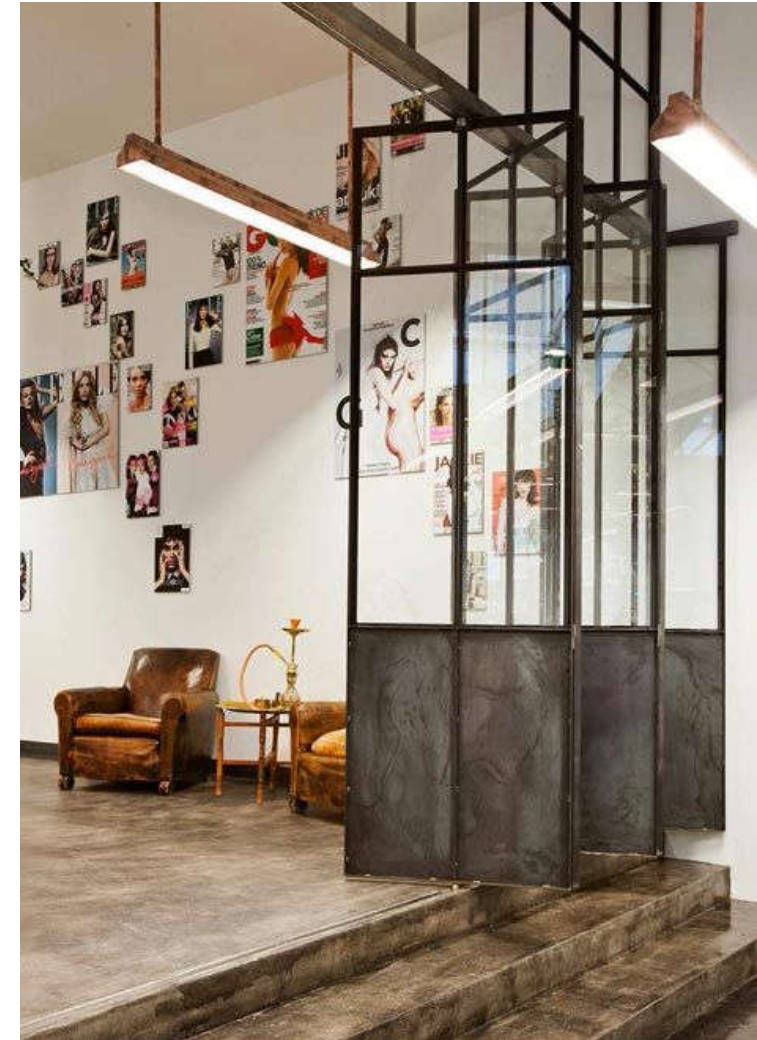

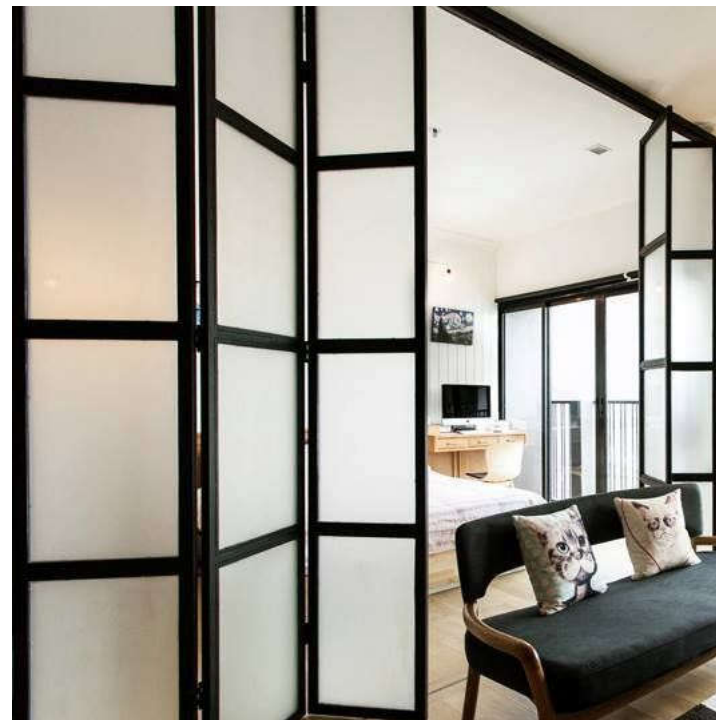

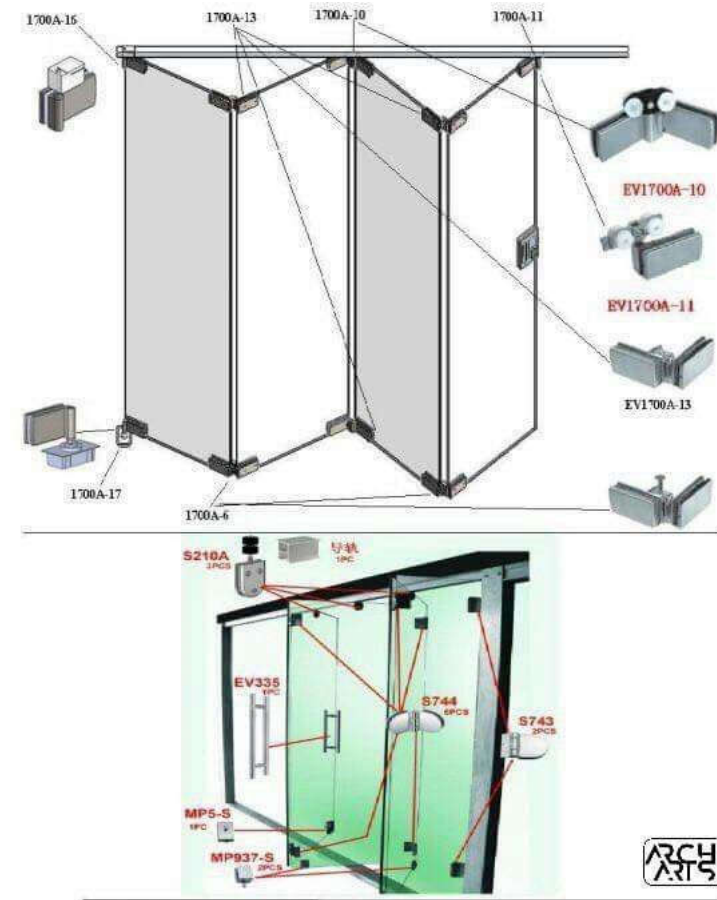

The lower frame can have a thicker profile to make a skirting and so protect against cleaning and dirt from the floor

Folding metal glazed panels

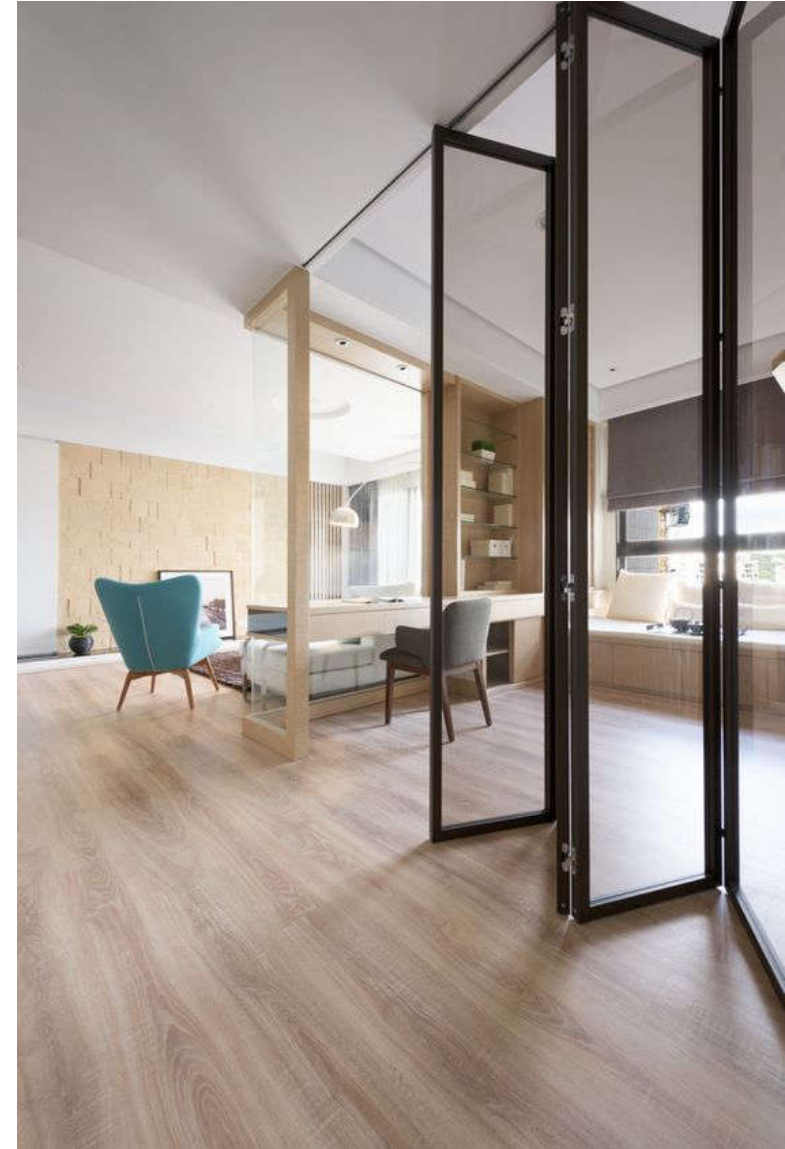

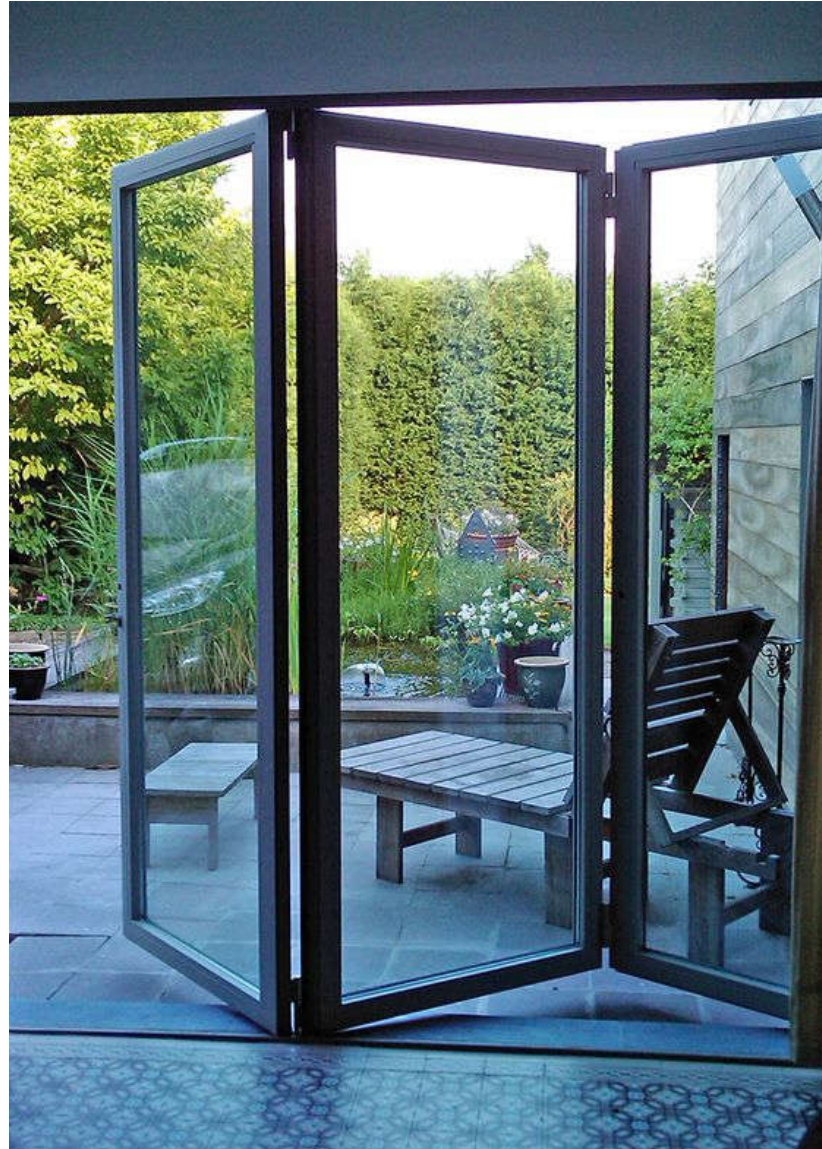

Panels are hung on rollers suspended from a channel. Two options, one roller fixed to the centre or fixed closer to the end. Panels are hinged to each other.

A channel is recessed into the floor as a guide for the panels but is not load bearing

Folding metal glazed panels

The top channel can be exposed as it is then easy to service and adjust

Heavy glazing systems

Walls – Startup and Children's areas

The startup and childrens rooms will have metal screens that are 2500 mm high and so do not go to the top of the arched ceilings. Fixed 100 mm square metal profiles are fixed to the flood slab and the ceiling with recessed metal plates
